ABSTRAK

Telah dilakukan penetapan kadar fenol total ekstrak etanol daun salam yang diberi perlakuan *Détente Instantanée Contrôlée* (DIC) pada tekanan 4,1 bar selama 39,14 detik, pada berbagai waktu ekstraksi. Penetapan kadar fenol total dilakukan dengan pereaksi *Folin Ciocalteu* secara spektrofotometri sinar tampak pada panjang gelombang 757,5 nm dengan asam galat sebagai pembanding. Kadar total fenol dari waktu ekstraksi 5 menit; 15 menit; 30 menit; 1 ; 1,5 ; 3 ; 4 ; 5 ; 6 ; 7 ; 8 ; dan 9 jam, masing-masing adalah 8,06; 8,08; 9,18; 9,44; 11,53; 10,79; 11,30; 12,68; 11,81; 11,53; 10,58; dan 8,17%. Waktu maserasi optimal adalah 5 jam dengan kadar fenol total 12,68%. Analisis hasil menggunakan ANAVA satu arah ($\alpha = 0,05$) dan dilanjutkan uji Tamhane diketahui bahwa ada perbedaan kadar fenol total yang bermakna pada beberapa waktu ekstraksi.

ABSTRACT

Determination of total phenol in Java Bay Leaf etanolic extract which were dried by the aid of *Détente Instantanée Contrôlée* (DIC) (4.1 bar for 39.14 seconds), at various extraction times has been done. It used *Folin Ciocalteu* reagent and the absorbance was detected by Visible Spectrophotometer at 757.5 nm using gallic acid as the standart. The fenol concentrations for extraction time 5 minutes; 15 minutes; 30 minutes; 1; 1.5; 3 ; 4 ; 5 ; 6 ; 7 ; 8; and 9 hours, are 8.06; 8.09; 9.18; 9.44; 11.53; 10.79; 11.30; 12.68; 11.8; 11.53; 10.58; and 8.17% respectively. The maximum times of extraction is 5 hours with concentration of phenol 12.68%. Using oneway ANOVA ($\alpha= 0.05$) and Tamhane, it was concluded that there are significant differences at some extraction times.
