Pembimbing: Prof. Dr. Yusti Probawati Rahayu

ABSTRAK

Penelitian ini membahas tentang hubungan *parental psychological control*, *emotional intelligence* dan disposisi berpikir kritis pada mahasiswa kedokteran. Mahasiswa kedokteran dituntut untuk memiliki disposisi berpikir kritis sejak masih dalam masa pendidikan hingga kelak saat menjalankan profesinya sebagai tenaga kesehatan. Masa perkembangan manusia tidak lepas dari pengaruh pola asuh orang tua, lebih daripada itu emosi juga memengaruhi perkembangan manusia. Karena itu, penelitian kuantitatif yang dilakukan terhadap 331 mahasiswa kedokteran di beberapa daerah di Indonesia ini dilakukan. Hasil penelitian ini menunjukkan ada hubungan antara *parental psychological control*, *emotional intelligence* dan disposisi berpikir kritis. Tidak ada hubungan langsung antara *parental psychological control* dan disposisi berpikir kritis nilai  $R = -0.073$  dan  $p = 0,0001$ . Namun, lebih lanjut ada hubungan antara *emotional intelligence* dan disposisi berpikir kritis dengan  $F = 2549,891$   $p = 0,940$

Kata kunci: *parental psychological control*, *emotional intelligence*, disposisi berpikir kritis

TITLE : The Relationship of Parental Psychological Control and Emotional Intelligence to Critical Thinking Disposition of Medical Students

ABSTRACT

*This research focused on the relationship of parental psychological control and emotional intelligence to critical thinking disposition of medical students. Medical students are expected to have critical thinking disposition not only after they graduated but since they are in the study field. The importance of critical thinking disposition in medical field is high due to risk faced time by time. Human thinking system development is affected by the parenting style, environment, and the development of emotion. This research, aim to 331 medical students in different cities in Indonesia. Result of this research shown that there is a relationship between parental psychological control, emotional intelligence and critical thinking disposition. However, the interesting part is that there is no direct relationship between parental psychological control and critical thinking disposition with  $R = -0.073$  and  $p = 0,0001$ . Yet, there is a direct relationship between emotional intelligence and critical thinking disposition with  $F = 2549,891$   $p = 0,940$ .*
