CONTENT vi

Pharmacogenetics: in case of cytochrome P450 oxidases (CYPs) related to adverse drug reactions 1–4
Arum Pratiwi, Harianto Lim and Ronny Martien

Interaction of turmeric and garlic extract combination against free radical scavenging activity 5–6
Patonah, Daryono H. Tjahjono, Elin Yulina S. and I Ketut Adnyana

Influenced of Kojic Acid and B-Cyclodextrin on SPF Value Sunscreen Product Contained Oxybenzone and Octyl Dimetyl Paba (3:7) (In vanishing cream base formulation) 7–14
Diana, Tristiana Erawati, Widji Soeratri and Noorma Rosita

Isolation and Antimicrobial activity of endophytic fungi Kabatiella caulivora var B isolated from Alyxia reinwardtii BL 15–17
Noor Erma Sugijanto, Dian Anggraeny and Noor Cholies Zaini

Rapid and Simple Luciferase Reporter Gene Assays for the Discovery of Peroxisome Proliferator-Activated Receptor α and γ Agonists and Nuclear Factor-κB Inhibitors from Medicinal Plants. 18–24

Identification of components of essential oil from Cananga odorata which penetrated into the rat skin / (Wistar strain) in the practice of Timung (development of Timung as alternative healing) 25–29
Mangestuti Agil, Esti Hendradi and Budiastruti

In Vivo Antihyperglycemic Test of Albedo Durian (Durio zibethinus M) Extract on Aloxan-Induced Diabetic White Rat (Rattus norvegicus) 30–33
F. M. Cahyani, I. Susanti, R. Ratna, Y. D. Panggi and Y. Pravitasari

Effect of Pasak Bumi’s Root (Eurycoma longifolia, Jack) on Sperm Output in Rats 34–37
Farida Hayati and Mustofa

Proceeding International Conference on Pharmacy and Advanced Pharmaceutical Sciences
Yogyakarta, Indonesia, 2009 xi
The Influence of Arbutin 3% and Sesame Oil (3,5,7 % w/w) on SPF Values of Oxybenzon and Padimate O (3.7% w/w) in carbomer Gel Base
Noorma Rosita, Tristiana Erawati and Rafi Jikrona

44 – 48

Sulochrin as α-glucosidase inhibitor lead compound
Rizna Triana Dewi, Ahmad Darmawan, Sofna D.S Banjarnahor, Hani Mulyani, Marisa Angelina and Minarti

49 – 54

The Practice of Complementary Indigenous Malay Therapies In Rural Areas: Do Users’ Attitudes, Beliefs And Perceptions Significantly Differ From Non-Users?
Pei Lin Lua, Rohayu Izanwati Mohd Rawi, Suffian Mohamad Tajudin, Norlida Mamat and Ahmad Zubaidi Abdul Latif

An Interventional Pilot Study: Effect Of Dark Chocolate Consumption On Anxiety Level Among Female Nursing Students
Sok Yee Wong, Pei Lin Lua, Rohayu Izanwati Mohd Rawi, Rokiah Awang, Ahmad Zubaidi and Abdul Latif

55 – 62

The Anti-proliferation Assay of Bioactive Fraction from Curcuma zedoaria Rhizome
Ros Sumarny, Priyosoeryanto B. P., letje W., Latifah K. D. and Chairul

63 – 67

Studies of Sub-acuteToxicity Assay from Acorus calamus L. in Experimental Animal Models
Banjarnahor S.D.S, Sri Hartati and Megawati

68 – 71

Antioxidant Properties and Phenolics Content of Mikania scandens L. (Wild)
Sumi Wijaya, Ting Kang Nee, Khoo Teng Jin and Christophe Wiart

72 – 77

The Influence of Olive Oil Addition on Increasing of Arbutin Penetration in the Carbomer-940’s Gel (Observation on Inhibition of Enzyme Tyrosinase Activity)
Widji Soeratri, Tristiana Erawati, Noorma Rosita and Fahriyatul Wahyuni

78 – 81

The difference of antioxidant activity of various tea (Camellia sinensis L.) methanol extract
Wahyu Widowati, Tati Herina and Hana Ratnawati

82 – 88

Chemical Stability of Cisplatin and Ondansetron During Simulation of hemotherapy Administration
Yahdiana Harahap, Rizka Andalusia and Armon Fernando

89 – 94

The Effects of Cassava Starch (Manihot utilissima, Pohl.) as a Binder on Physicochemical Characteristics of Acetaminophen Tablet Formulation
Yandi Syukri, Tri Rahayu Ningsih and M. Hatta Prabawa

95 – 98

Drug Interaction Study in Hospitalized Hepatic Cirrhosis Patient in Dr. Ramelan Navy Hospital
Amelia Lorensia, Aziz Hubeis, Widjati and Hary Bagijo

99 – 102

The Effect of Cold Storage in Krebs-Henseleit Buffer in the Viability and Metabolic Activities of Precision Cut Intestinal Slices
Dewi Setyaningsih, AA Khan and GMM Groothuis

103 – 110

Proceeding International Conference on Pharmacy and Advanced Pharmaceutical Sciences
Yogyakarta, Indonesia, 2009
The Effect Of b-Cyclodextrin And Oxybenzone-Octyl Dimethyl Paba (3.7% W/W) Addition On The Penetration Of Kojic Acid In Vanishing Cream (Based on Activity Inhibition of Tyrosinase)
Diana Winarita, Tristiana Erawati, Noorma Rosita and Widji Soeratri

111 – 116

The profile of knowledge and self-medication in handling cough symptoms by students of pharmacy at Airlangga university
Elida Zairina, Liza Pristianty and Lestriana Kusumasari

117 – 120

The Characteristics and Release of Diclofenac Sodium of Niosome System in Carbomer 940 Gel Base Preparation (Niosome System of Diclofenac Sodium-Span 60-Cholesterol with Molar Ratio 1:5:5)
Esti Hendradi, Tutiek Purwanti, Bety Nurfitia Puspitarini and Bianda Ida Kurnia

121 – 128

Red Betel Vine (Piper Crocatum) Essential Oil as Antituberculosis
Farida Juliantina Rachmawaty

128 – 133

Effect of Pasak Bumi’s Root (Eurycoma longifolia, Jack) on Sperm Output in Rats
Farida Hayati and Mustofa

134 – 137

The Influence of Sesame Oil Addition on Arbutin Release from Carbomer-940 Gel Bases
Hanifa Rahma, Tristiana Erawati and Noorma Rosita

138 – 141

Phytochemical Screening and Determination of Antioxidant Activity of Fractions from Ethyl Acetate Extract of Phyllanthus acidus (L) Skeels Leaf
Hindra Rahmawati, Hesty Utami and Moordiani

142 – 145

Study on Antihyperglycaemic Activity of Ethyl Acetate Extract of Sidaguri (Sida rhombifolia L.) Stem on Alloxan-Induced Diabetic Mice (Mus musculus L.)
Irma Ratna K, Muk tiningsih, Suhartono, Natalia Elisabet be and Muhammad Ali Zulfikar

146 – 152

The Influence of Arbutin and Olive Oil as an Enhancer in Characteristic and SPF Value of Sunscreen (Combination of Oxybenzone and Octyldimethyl Paba in Carbomer 940 Gel Base)
Josephine Paramita Ayuningtyas, Tristiana Erawati, Noorma Rosita and Widji Soeratri

153 – 160

The Effect of Secondary Emollients Triethylhexanoate, Isopropyl myristate, and Propylene glycol Isostearate on in-vitro skin penetration of tocopheryl acetate cream using Franz-diffusion cell
Joshita Djajadisastra, Sutriyo and Fraida Aryani

161 – 165

Immunomodulatory activity of Plantago major L. on IgM titer of mice
Kartini, A. Kirtishanti, Dessy, Fauziah and Isnaini

166 – 169

Antibacterial activities of Aleurites moluccana (Euphorbiaceae)
Othman Abd Samah and Rasyidah Mohamad Razor

170 – 178

Total synthesis and revised structure of benzophenone glucopyranosides from phaleria macrocarpa
Phebe Hendra, Yuki haru Fukushima and Yasuyuki Hashidoko

179 – 185
Influence of Tween 80 Concentration in Carbomer/ Tween 80 Aggregate on Kojic Acid Penetration (Observed on Inhibiting Tyrosinase Activity in Vanishing Cream)
Siti Evi Jayanti, Tristiana Erawati and Noorma Rosita

Validation for Result Degradation of Nifedipine Residue with Thin Layer Chromatography- Densitometry and Thin Layer Chromatography- Spectrophotometry
Sitti faika and Sudibyo Martono

Synthesis and Biological Activity Test of Antibiotic UK-3 Analogues, 2-Hydroxycytotinyl-Butyl-Serine-Ester and Its Derivatives
Ade Arsianti, Kiyomi Kakiuchi, Tsumoru Morimoto, M.Hanafi and Endang Saefudin

Vitamin e content in the dragon fruit Established by high performance thin layer chromatography- densitometry
Any Guntarti and Warsi

Drug interaction study in hospitalized hepatic cirrhosis patient in Dr. Ramelan navy hospital
Amelia Lorensia, Aziz Hubeis, Widyati and Hary Bagijo

PGV-1 inhibits G2M phase progression in WIDr colon cancer cell

Development and Production of Anti Tuberculosis Fixed Dose Combinations (FDCs)
Barokah Sri Utami, Syamsul Huda, Nurliya Irfiani and Badrus S.

The Characteristics and Release of Diclofenac Sodium of Niosome System in Carbomer 940 Gel Base Preparation (Niosome System of Diclofenac Sodium-Span 60-Cholesterol with Molar Ratio 1:5 :5)
Esti Hendradi, Tutiek Purwanti, Bety Nurfitia Puspitarini and Bianda Ida Kurnia

The Characteristics and Release of Diclofenac Sodium of Niosome System in Carbomer 940 Gel Base Preparation (Niosome System of Diclofenac Sodium-Span 20-Cholesterol with Molar Ratio 1:5 :5)
Esti Hendradi, Tutiek Purwanti, Anditasari and Srimayati

An Interventional Pilot Study: Effect Of Dark Chocolate Consumption On Anxiety Level Among Female Nursing Students
Sok Yee Wong, Pei Lin Lua, Rohayu Izanwati Mohd Rawi, Rokiah Awang and Ahmad Zubaidi Abdul Latif

Antiemetics utilization in cancer patients with high emetogenic cytotoxic drugs in two govermental hospital in indonesia
Dyah Aryan Perwitasari and Ana Hidayati

KEY WORDS INDEX

DISCUSSION
Immunomodulatory activity of *Plantago major* L. on IgM titer of mice

Kartini*, A. Kirtishanti, Dessy, Fauziah, Isnaini  
Faculty of Pharmacy, University of Surabaya  
kartini@ubaya.ac.id

**Abstract**

Immunomodulatory activity of four fractions from *Plantago major* L. (n-hexane, ethyl acetate, n-butanol and water) on titer of IgM has been carried out on mice, ex vivo. Each test sample was taken orally during 7 days, single dose, at 3 different level dose. Titer of IgM has been determined using agglutination method, 5 days after immunization with sheep red blood cell (SRBC). All of the fractions has capability in increasing the titer of IgM, but the highest activity resulted from n-hexane fraction.

Key words: immunomodulator, *Plantago major* L., titer of IgM

**Introduction**

Immune system is a combination of cells, molecules and tissues that play a role in resistance to various diseases, especially infections. Drugs which can restore the imbalance in the immune system called as immunomodulator. The immune system is divided into two categories: specific and non-specific, each consisting of cellular and humoral immune system. Complements, interferon, C-reactive protein (CRP) are some examples of non-specific humoral defense, while the antibody including specific humoral immune components. The main function of antibodies is a defense against viral infections and extra cellular bacteria, also neutralize its toxin (1).

Antibodies are formed through the theory of "Two Signal Theory", meaning that antibodies will be formed if there are 2 signals: the first one is derived from the bond between the APC/Antigen Presenting Cell (B lymphocytes, monocytes, macrophages) and T-helper (especially TH2); the second, is derived from cytokines released by activated T-helper (2).

One of the plants whose immunomodulatory activities is *Plantago major* L. ("daun sendok"). Their activity are: chemotactic activity in neutrophiles (3); increase NO & TNF-α production (4); enhance lymphocyte proliferation and secretion of IFN-γ (5); increase phagocytosis by monocytes and macrophages (6).

The activity of immune system components are interrelated, it is interesting to study the role of *P. major* L. in enhancing phagocytosis by monocytes and macrophages, and the ability to increase the production of antibodies. Based on "Two Signal Theory", it is predicted that *P. major* L. be able to increase the production of antibody, especially IgM as the primary antibody response.

This study have been conducted to investigate the immunomodulatory activity of *P. major* L. leaves on the formation of IgM, which is determined by measuring IgM titer. In order to guide the discovery of bioactive compounds, tests carried out on chemical fractions of *P. major* L. leaves, i.e.: n-hexane, ethyl acetate, n-butanol and water.

**Methodology**

**Materials**

Materials are the : leaves of *Plantago major* L. (obtained from the Village Tiekung, District Jungrejo, Batu; determination conducted by the Center for Information and Development of Traditional Medicine, UBAYA), methanol, grade (Mallinckrodt), n-hexane (Riedel-deHaen), ethyl acetate (Merck), n-butanol, Aqua bidestilata (Ikapharmindo Putramas), CMC Na, normal saline (B. Braun) and sheep red blood cells (SRBC).

Test animals are mice, BALB/c strain, male and female, aged 1-2 months (obtained from Laboratory of Pharmacology, Faculty of Pharmacy, UBAYA).

Equipment
Instrument uses are: rotary evaporator (Heidolph), centrifuge (Hettich), hemocytometer, electrical mixer (Ika Labortechnik), water bath (Memmert), Oven (Binder), ultrasonic bath (Branson), injection syringes (Terumo), sonde, incubator shaker (GFL), micro titer plate, micropipette (Socorex), Pasteur pipette, magnifying glass, surgical instruments and glass instruments.

Preparation of P. major L. fractions:
All of the fractions (n-hexane, ethyl acetate, n-butanol and water) are prepared according to the Markham (7) with slight modifications. Dried powder of samples (±800 g) was extracted with methanol through kinetic maceration (3 hours), then soaked (24 hours) and filtered. Residue is extracted again in, similar using methanol-water (9:1) and methanol-water (1:1), respectively. Three extracts are combined, concentrated under vacuum and water bath (± 60°C). The viscous extract are diluted in hot water (10 x weight of viscous extract), then shaken in a separation funnel with n-hexane, ethyl acetate and n-butanol, respectively.

Preparation of sample for oral
In this study, a negative control (0.5% CMC-Na) and three different doses of each fraction have been used (Table 1). Each fraction was in suspension in 0.5% CMC-Na, given in 0.5 ml, orally once daily for 7 consecutive days.

Determination of the primary antibody response (IgM)
Antibody titer is the highest of the serum dilution that still gives agglutination reaction. Agglutination is positive when there is a visible layers of erythrocytes with evenly or diffuse edge (not flat) on the basis of sinks (micro titer plate) and transparent liquids without the occurrence of the point-shaped erythrocyte sedimentation in the middle of sinks. IgM titer is determined as follows (8): serum of mice taken from the heart, 5 days after immunization with SRBC (10⁵ cells/ml, intra-peritoneally). Serial dilutions of serum using double dilution method was carried out on sinks (100 μl). 100 μl phosphate buffer solution was used as control solvent. 100μl SRBC (10⁵ cells/ml) is added into each sinks, shaken for 5 minutes and then incubated for 30 minutes in 37°C. Finally, the mixture left overnight at room temperature. Agglutination results read under a magnifying mirror, titer expressed as the denominator of serial dilutions at the numerator=1 (reciprocal).

Analysis
To determine the influence of each P. major L leaves fractions on the formation of IgM titer of mice, the average IgM titer of the treatment group are compared with the control group using non-parametric statistical analysis (Kruskal-Wallis at α = 0.05).

Results and Discussions
The extraction carried out on 876.4968 g of dry leaf powder, yielded 166.7127 g (19.02%) methanol extract. N-hexane, ethyl acetate, n-butanol and water factions produced from this extraction is: 14.72; 4.36; 18.56 and 48.07% methanol extracts, respectively. Influence of each fraction on the titer of IgM is shown in table 2 and figure 1.
Figure 1. Graph of the Influence of n-hexane (NH), ethyl acetate (EA), n-butanol (NB) and water (W) fraction of P. major L. leaves on IgM titer of mice.

</table>

Table 2 and figure 1 showed that IgM titer at all doses treatment groups (except the EA fraction) is relatively higher compared to the control group. Therefore, it is proved that all of fractions of P. major L. leaves increase the titer of IgM, but at different dose, also in different enhancement level. Statistical analysis (Kruskal-Wallis, $\alpha=0.05$) shown a significantly differences (significance of four fractions: 0.04; 0.000; 0.001 and 0.018, respectively). All are smaller than 0.05, so it can be concluded that all of fractions can increase the IgM titer of mice.

Figure 1 shown the differences between doses and IgM titer of each fractions. In n-hexane and water fractions, higher dose of the test material, give the lower of the titer IgM. However, the opposite occurs in ethyl acetate and n-butanol. By considering the doses, it can be concluded that the n-hexane fraction at dose equivalent to 400 mg of methanol extract/kg BW of mice can increase the IgM titer at highest level.

Figure 2. Result of Hemagglutination test using SRBC as antigen: before (a) and after (b) incubation overnight at room temperature.

In this study the measurement of antibody titer was done by hemagglutination method (Figure 2), where particulate antigen bounded by IgM antibodies in the form of pentavalent/pentamer, so lattice (agglutination results) can be seen easier. SRBC is the best antigen for antibody production test on mice. More over, it is belong to T-dependent, so in stimulating the formation of antibodies requires T lymphocytes facility. Another antigen that can be used is: fowl gamma globulins/immunoglobulin from poultry (9).

Based on the "Two Signal Theory", the role of each P. major L. leaves fractions in improving the IgM titer was estimated as adjuvant to stimulate phagocytosis process by
monocytes/macrophages. So many more antigens presented by monocytes/macrophages with MHC II molecules to be recognized by TH₂. It will stimulate TH₂ to secrete IL-4 and IL-5. When the secretion of IL-4 and IL-5 increase, the stimulation of B cells increased, IgM secretion was also increased. This is supported by previous research which proved that *P. major* L. can enhance phagocytosis by monocytes and macrophages (6). The other mechanisms, fractions of *P. major* L. leaves stimulate effectors cells (B lymphocytes) directly to synthesize antibody.

*Since P. major* L. leaves enhance cellular immune responses as well as the humoral, this plant can be predicted as a potential candidate for an immunomodulator. One to consider is as adjuvant or supportive therapy to overcome the unwanted side effect of chemotherapy (most of them are immunosuppressant).

**Conclusion**

N-hexane, ethyl acetate, n-butanol and water fraction of *Plantago major* L. leaves given orally to mice can increase the titer of their IgM. N-hexane fraction of *Plantago major* L. leaves has the highest activity in increasing IgM titer.
