Abstract: Rural Bank 'X' is one of the banks that focuses on offering credits to the society. In their daily activities, the Bank encounters some problems such as mistakes in transaction recording and interest miscalculation in both saving accounts and loan accounts. Furthermore, accounting reports generated are also inaccurate and time-consuming. In order to overcome those problems, a computer software is developed for the accounting information system. The software is thoroughly tested in order to comply with user requirements and minimize errors. There are two testing stages: the software features testing and the user-acceptance testing. The testing results are carefully evaluated to make sure whether the computerized system can run perfectly and produce results correctly. In conclusion, the software can perform well in accordance with user requirements.
